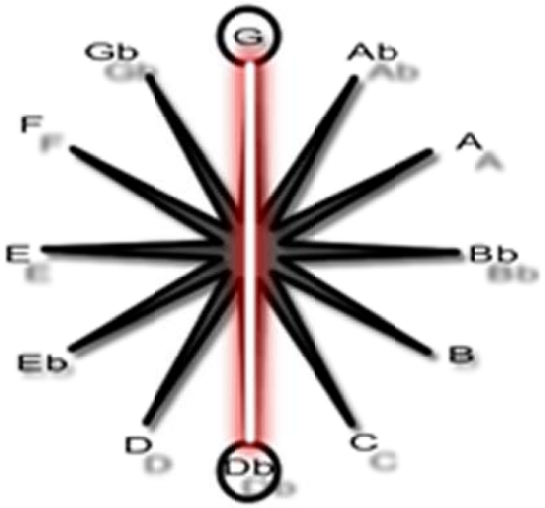
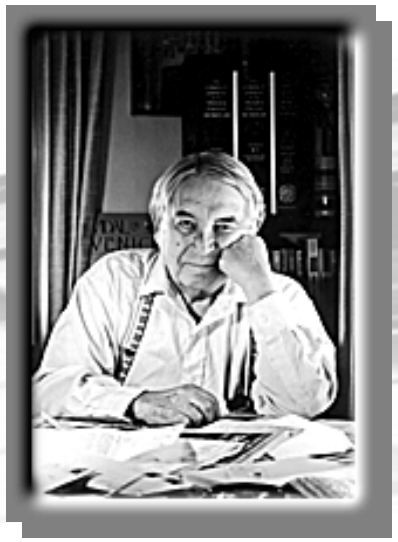
Symmetrical Harmonies for Jazz Guitar



"The Tritone Progression"

by John Riemer



Symmetrical Harmonies for the Jazz Guitar

Derived from Nicolas Slonimsky's "Thesaurus of Scales and Melodic Patterns"

Part 1-The Tritone Progression

Nicolas Slonimsky was a Russian-American musicologist; born in St Petersburg April 27, 1894, and died in Los Angeles December 25, 1995. Among the things he wrote one of the most influential to jazz musicians was his *Thesaurus of Scales and Melodic Patterns* (1947, Macmillan Publishers), an inventory of tonal combinations, expressed as patterns and scales. It is based on symmetrical divisions of the octave or octaves and then embellishes the tones that are generated by the divisions (principal tones). He then ornamented these principal tones by using neighboring notes of uniform intervals. The addition of an ornamental note or notes to the principal note is, at the risk of over simplifying, the heart of Slonimsky's approach.

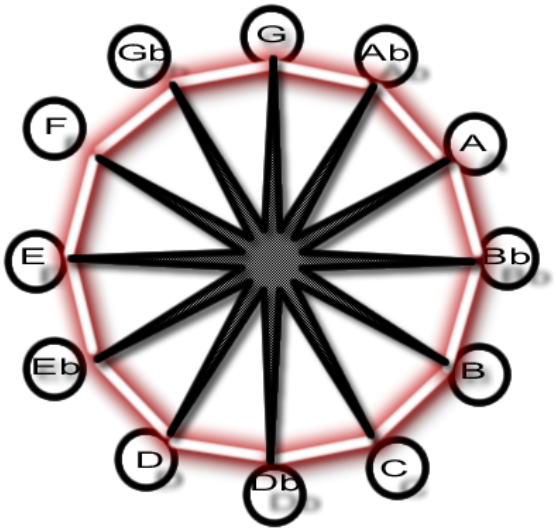
It is generally rumored that John Coltrane studied his book Included in the studies of the book are patterns and harmonies that are created by dividing the octave or octaves into equal parts that are evident in Coltrane's work.

Frank Zappa had Slonimsky perform, playing electric piano in concert. Both Slonimsky and Zappa spoke with high regard of each others work.

The Disclaimer

When approaching this man's material I was overwhelmed by his thoroughness and the scope of his concept. My hope was to apply his approach to the guitar. The range of the piano puts many of the divisions out of reach to the guitarist. This helped reduce the possibilities because I worked within the typical 3 ½ octave range that guitarists are accustomed to using. Many of his terms (sesquitone, ultra interpolation, etc) are unfamiliar to most people on this planet so I try to express these terms in a simpler descriptive manner. I apologize for any liberties I have taken that might offend.

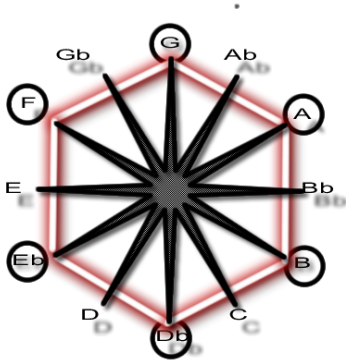
Having 12 half steps to the octave creates divisions that are factors of 12.



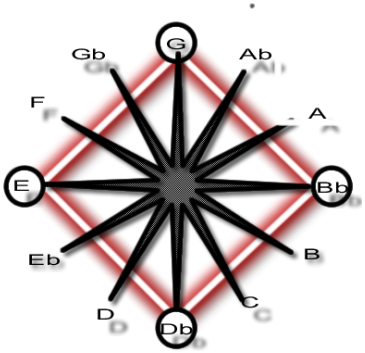
One octave may contain 12 divisions.
This would yield a Chromatic scale.

Here are the possibilities for equal divisions of one octave

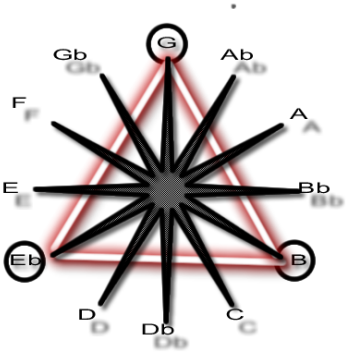
Divisions	12	6	4	3	2
scale or interval	Chromatic	Whole tone	Diminished	Augmented	Tritone



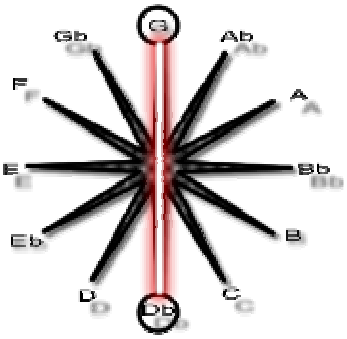
Whole tone



Diminished



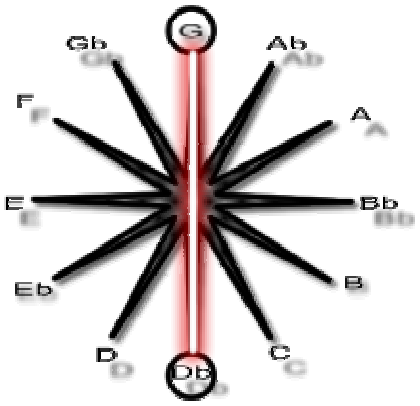
Augmented

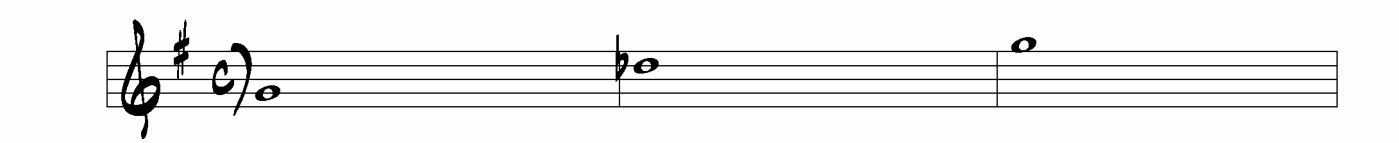


Tritone

The Tritone Progression

The simplest exercise is the “Tritone Progression” or the division of one octave into two equal parts. In the tritone progression an octave is divided into two parts yielding the two principle notes from which the patterns will develop.





The Tritone Exercises

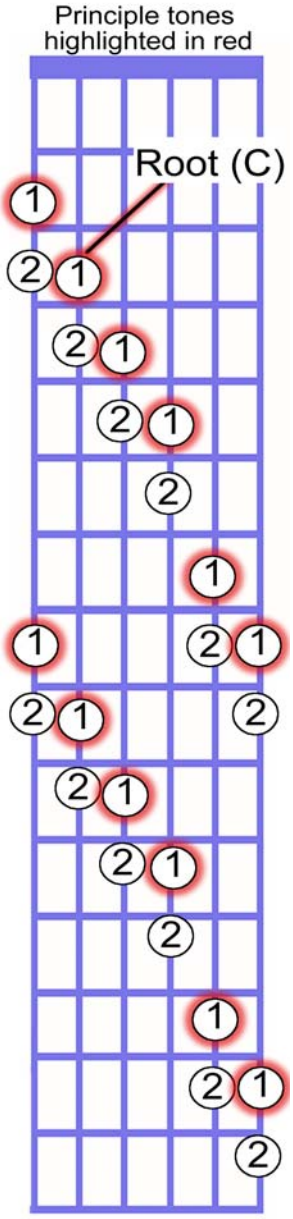
Following are the tritone exercises with a note added ½ step above the principal tones (C and Gb) in the key and order that they appear in the original book. I have included a pattern that does not appear in Slonimsky’s work, the one that adds a note a minor third above the principal notes. I include all patterns that are suggested by the principal notes and ornamentations. Slonimsky omits some patterns that are suggested by his technique. One such pattern is marked 3*.Perhaps he omitted it because it is a diminished arpeggio. My work is focused on developing a chord relationship to the patterns. I have tried to connect chords that are commonly in use in jazz by analyzing the pattern over various roots.

Course of Study

- This first exercise will serve as a template of study for all the patterns.
- The principal tones are defined and the embellishments are added.
- The pattern or **tone cluster** that is created will be examined by first establishing the tones as roots of chords.
- Then the tones will be considered as 3rds, 5ths, 7ths, and 9ths of a chord.
- Ambiguities and redundancies will be noted.
- In all chord instances the single note pattern remains the same except for possible accents placed on chord tones.
- Usual symbols prevail…some that might differ;
    - + Means augmented or sharped…
    - -Means diminished or flatted (minor)
    - Maj7….natural 7th
    - Dom 7…flatted 7th
    - Sus…usually no 3rd , 4th instead
    - 11th chord…usually has the third when possible
    - Notes added to create chord that are not part of the original pattern will be marked with (*)
    - Notes in conflict that should be avoided are within <conflict> arrows
    - Cluster tones, i.e., principal tones plus the added ornament notes, will be in **bold** type

Exercise #1

PAGE 1
EXERCISES 1-4
ONE OCTAVE DIVIDED INTO TWO PARTS
INTERPOLATION OF ONE NOTE
C7 - 9 - 5
#1

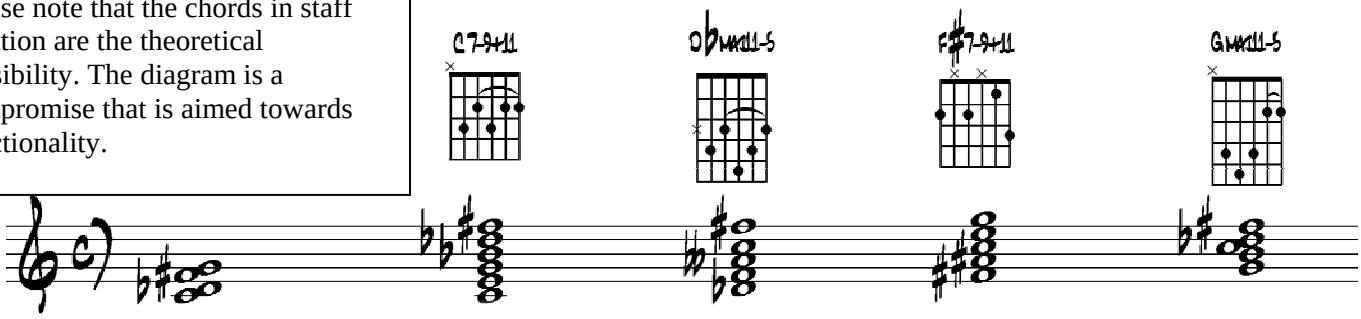


Principle tones
highlighted in red
Root (C)

Here are some of the chords suggested by this pattern.

The cluster created by this pattern may be taken apart and each note may serve as a root

Please note that the chords in staff notation are the theoretical possibility. The diagram is a compromise that is aimed towards functionality.



The tone cluster-	**C as root**	**Db as root**	**F# as root**	**G as root**
The names could be;	**C7-9+11**	**Dbmaj11-5**	**F#7-9+11**	**Gmaj7-5**

These are theoretical possibilities and not all are feasible or easy to play. To streamline this study I will present the chord forms and pattern relationships that I feel would be useful to the jazz guitarist.

Chords suggested by the tritone progression

"ONE OCTAVE DIVIDED INTO TWO PARTS, INTERPOLATION OF ONE NOTE"

THE CLUSTER TONES C,C#,F#,G IN RELATIONSHIP TO THE CHROMATIC SCALE IMPLY THESE CHORDS.

Cluster Tones-->	C	C#	F#	G	chord implied	Character
C	octave	-9	b5/#11	5	**C7-9+11**	Tension
C#/Db	7	octave	11	b5/#11	**C# lydian (maj7+11)**	Release
D	b7	7	3	4th/11th	**D11 (BeBop 7th)**	Build
D#/Eb	6th/13th	b7	b3/#9	3	**Eb13#9**	Tension
E	#5/b13	6th/13th	9	b3/#9	**Ealt**	Tension
F	5	#5/b13	b9	2	**F alt**	Tension
F#/Gb	b5/#11	5	octave	b2/b9	**F#/Gb alt**	Tension
G	4th/11th	b5/#11	7	octave	**G lydian**	Release
G#/Ab	3	4th/11th	b7	7	**G# <ambiguous>**	<ambiguous>
A	b3/#9	3	6th/13th	b7	**A13#9**	Tension
A#/Bb	2	b3/#9	#5/b13	6th/13th	**Bbm13**	Build
B	b2/b9	2	5	#5/b13	**B <ambiguous>**	<ambiguous>

The chromatic scale as possible roots

Cluster tones create these intervals when a root is chosen from chromatic scale

NOTE: ALL OF THE FOLLOWING CHORDS ARE IN VARYING DEGREES OF AGREEMENT WITH THE PATTERN CREATED IN EXERCISE #1

Notes added to create chord that are not part of the original pattern will be marked with (*)
Notes in conflict that should be avoided are within <conflict> arrows

- **Cluster Tones as the <u>ROOT</u>**

Root	D	Eb*	Ab	A

In reviewing the chords that are implied by exercise #1 that the chords fall into 4 general categories;

The Chords created by pattern#1:

C7-9+11	**Dbmaj9+11**	**F#7-9+11**	**Gmaj7-5**
Am13	**A#/Bb m13+5**	**Ebm 13**	**Em9**
Ab BeBop 13th	**A13+9**	**D BeBop 13th**	**Eb13#9**
Gsus 13-5	**Absus 13-5**	**Db7sus**	**D7sus**
F7+5-9	**F#7-5-9**	**B7+5-9**	**C7-9+11**
D11	**Eb13#9**	**Ab11**	**A13#9**

The

1. Tonic or **Release** Quality- **I chord**
2. Subdominant (super tonic) or **Build** Quality **II chord**
3. Dominant or **Tension Quality** **V chord**
4. **Ambiguous**-not easily categorized **II chord???**

These chords were generated by imagining a root using the chromatic scale as the source. The first chord (C7-9+11) was arrived at by using C as the root and deciding what the rest of the cluster (i.e. C#, F# and G) would create over that root. The same was done for the rest of the chords using the root from the chromatic scale. Notes were added where necessary to create a chord that has common (?) usage.

Applying the pattern to a progression

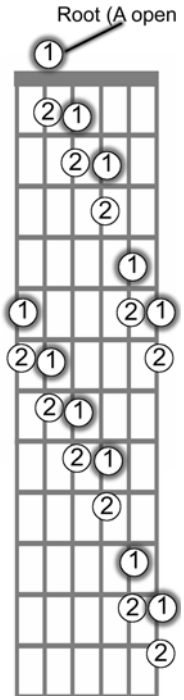
Tritone exercise #1 suggests chords that are appropriate for "two, five, one" sequences but the suggested chords are in different keys. This would suggest that moving the tritone exercise to a couple of different starting points we might be able to cover the two, five, one sequence with very little movement

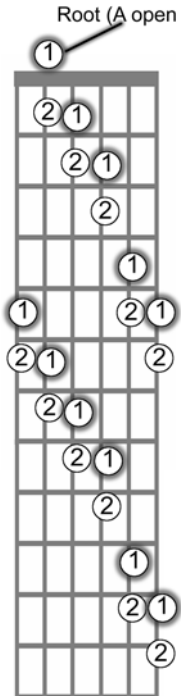
The choices are many and I will present what works for my ear. I encourage further experimenting to broaden the use of these patterns. Look for simple solutions to the harmonic structures. In the heat of playing, the ideas will be easier to summon. My rule is, "If it sounds right, it is right!"

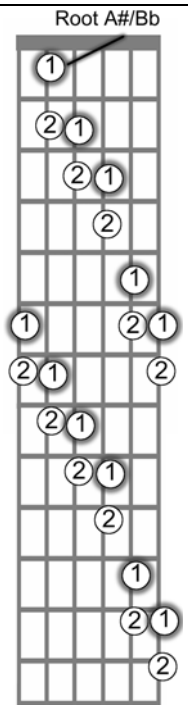
This chart demonstrates a transposition of a fifth

Chords implied root of cluster=C	Chords implied root of cluster=G	Chord Quality
C7-9+11	G7-9+11	V
C# lydian (maj7+11)	G# lydian (maj7+11)	I
D11 (BeBop 7th)	A11 (BeBop 7th)	I or V
Eb13#9	Bb13#9	V
Ealt	Balt	V
F alt	C alt	V
F#/Gb alt	C#/Db alt	V
G lydian	D lydian	I
G# <ambiguous>	Eb<ambiguous>	?
A13#9	E13#9	V
Bbm13	Fm13	II
B<ambiguous>	F#<ambiguous>	?

Two, Five, One Progression (II, V, I)

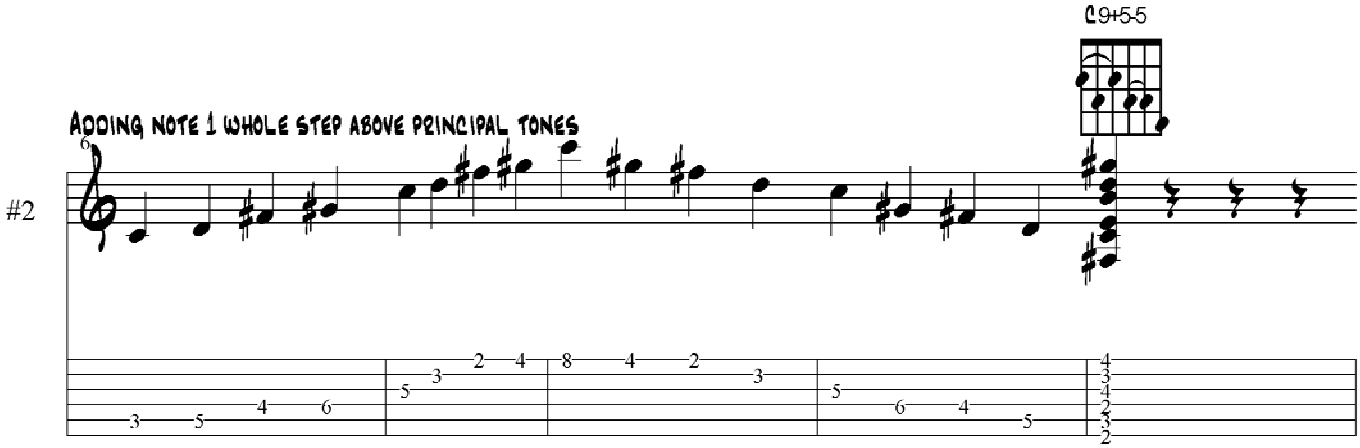
Build (II) **Gm13**	**Tension (V)** **C7-9+11**	**Release (I)** **F lydian**
		The transposition to A (starting principal tones=A/Eb) would be necessary to create a Gm II chord.	Many choices for the dominant. Keeping the pattern rooted to "A" would imply a C13#9.This would also minimize hand motion.	The One chord occurs (for exercise #1) only when C# and G# are used as roots. The transposition to A# (starting principle tones=A#/E) or E(starting principal tones=E/A#) would be necessary to create a Fmaj7 I chord.
		


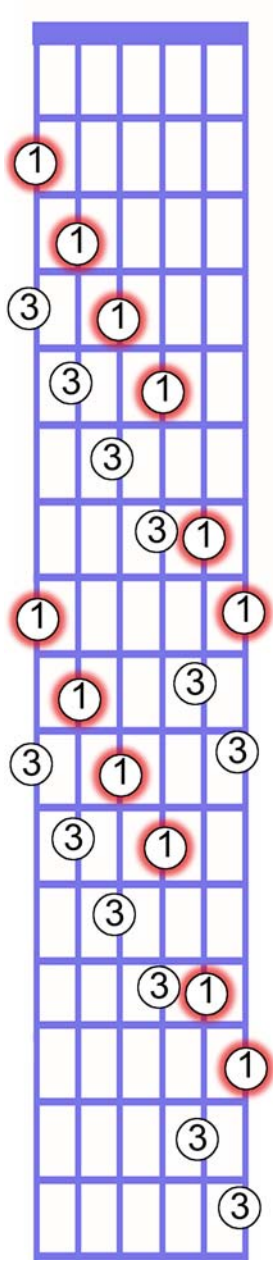




Exercise#2

Exercise number two uses the same principal tones (C and F#) and adds notes one whole step above each tone (D and G#). All chords following will be a suitable accompaniment for exercise #2





THE CLUSTER TONES C, D, F#, G# IN RELATIONSHIP TO THE CHROMATIC SCALE IMPLY THESE CHORDS.

Cluster Tones-->	C	D	F#	G#	chord implied	Character
C	Octave	9	b5/#11	#5/b13	**C7+5+11**	Tension
C#/Db	7	-9	11	5	**C#maj7-9**	Release
D	b7	Octave	3	b5/#11	**D7-5**	Tension
D#/Eb	6th/13th	7	b3/#9	4th/11th	**Ebmi(maj7)**	Build
E	#5/b13	b7	9	3	**E9-13**	Tension
F	5	6th/13th	b9	b3/#9	**Fm13-9**	Build
F#/Gb	b5/#11	#5/b13	Octave	9	**F#9b5b13**	Tension
G	4th/11th	5	7	Octave	**Gmaj7sus4**	Release
G#/Ab	3	b5/#11	b7	7	**G#7-5**	Tension
A	b3/#9	4th/11th	6th/13th	b7	**Am11**	Build
A#/Bb	2	3	#5/b13	6th/13th	**A#13#5**	Build
B	b2/b9	b3/#9	5	#5/b13	**Balt**	Tension

The chromatic scale as possible roots

Cluster tones create these intervals when a root is chosen from chromatic scale

- **Cluster Tones as the <u>Root</u>**

Chord Name And Diagram	**C9+5+11** 	**D7-5** 	**F#9+5+11** 	**G#7-5** comment	***Reciprocal of F#9+5+11 Root not used	Best fit…no added notes Same as G#7-5 (reciprocal chord)	Reciprocal of C9+5+11	Best fit…no added notes Same as D7-5 (reciprocal chord)
13th	Not necessary	Not necessary	Not necessary	Not necessary
11th	F#= +11	Not necessary	C= +11th	Not necessary

9^{th}	Not necessary	F#	Not necessary	C
7^{th}	**C**	**D**	**F#/Gb**	**G#/Ab**
5^{th}	Ab=flatted 5^{th}	B*(not used)	Eb not used	F#/Db=sharp 5^{th}
3^{rd}	F#	G#	C	D
Root	D	E*	Ab	Bb

Making use of pattern #2

The chords generated in exercise #2

C9+5+11	**D7-5**	**F#9+5+11**	**G#7-5**
Am13 nat.7	**Bm13-9**	**Ebm(maj7)**	**Fm13-9**
Ab7-5	**Bb9#5**	**D7-5**	**E9#5**
Maj 7-9 sus 4	**Ami (maj7) 13**	**Dbmaj7-9sus4**	**Eb mi (maj7) 13**
Fmi13-9	**GMaj11-9**	**Bm13-9**	**C#mi11-9 nat 7**
D7-5	**E9-13**	**Ab13+11**	**Bb9+5**

From the above chart chord choices that satisfy the II, V, I chord progression may be made with no transposition. To make this work with a single note line, notes outside of the chord cluster will have to be played to establish and define the chord movement.

II, V, I

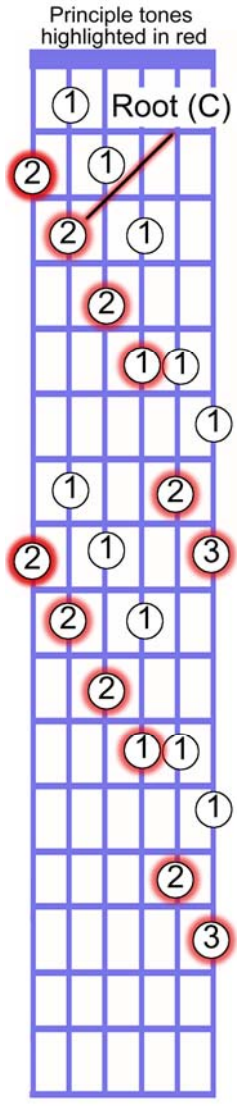
Ami (maj7) 13 
D7-5 
GMaj11-9 
Because of the rather dissonant I chords (the Gmaj7 and D maj7 have an unsettling flatted 9th) it would be better to resolve to a more tonic quality harmony such as the G maj7-5 from exercise #1.

Ami (maj7) 13 
D7-5 
Gmaj7-5 
Resolve using pattern from exercise#1

"IF IT SOUNDS RIGHT, IT IS RIGHT!"

Exercise #3

Exercise number two uses the same principal tones (C and F#) and adds notes2 steps above each tone (E and A#/Bb)



Analysis

Cluster Tones-->	C	E	F#/Gb	A#/Bb	chord implied	*Character
C	Octave	3	b5/#11	b7	**C7-5**	Tension
C#/Db	7	b3/#9	11	6th/13th	**C#mi13th ma7**	Release
D	b7	2nd /9th	3	#5/b13	**D9-13**	Tension
D#/Eb	6th/13th	b2/b9	b3/#9	5	**Ebmi 13b9**	Build
E	#5/b13	Octave	2nd /9th	b5/#11	**E9b5b13**	Tension
F	5	7	b9	4th/11th	**Fmaj11-9**	Release
F#/Gb	b5/#11	b7	Octave	3	**Gb7b5**	Tension
G	4th/11th	6th/13th	7	b3/#9	**Gmi13maj7**	Release
G#/Ab	3	#5/b13	b7	2nd /9th	**G#9-13**	Tension
A	b3/#9	5	6th/13th	b2/b9	**Am13-9**	Build
A#/Bb	2nd /9th	b5/#11	#5/b13	Octave	**Bb9b5b13**	Tension
B	b2/b9	4th/11th	5	7	**Bmaj11-9**	Release

The chromatic scale as possible roots

Cluster tones create these intervals when a root is chosen from chromatic scale

* **Character=**This is a rough determination as to how the chord might be used-

- Release= I chord
- Build= II chord
- Tension = V chord

This determination has been made by the structure, the sound and connotation will help you make the decision as to how the chord is used.

- **Cluster Tones as the <u>Root</u>**

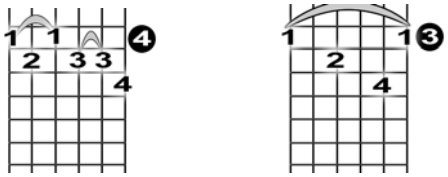
Cluster tones as the Major 3rd and Dominant 7th are perhaps the most useful forms, and the most clearly stated sounds. IF IT SOUNDS RIGHT, IT IS RIGHT!

In summary:

This relationship, i.e., cluster tones C, E, Gb, Bb generate a strong flatted fifth sound, as should be obvious because the cluster is a flat five chord in itself. The minor13th maj7th make an interesting release chord in the right setting.
Here is a resolution using only pattern #3 and the chords that are generated from it.

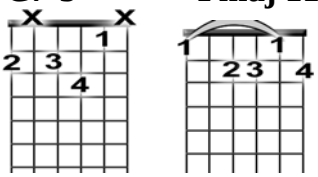
D9#5 **Gmi13 maj7**



It may a bit of a stretch to hear it the first couple of times but with repetition it will start making musical sense.

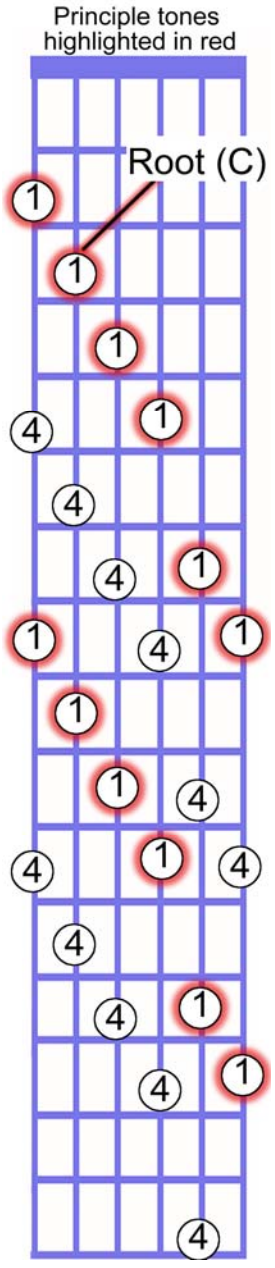
Here is what would be considered an enigmatic (???) ending, again using only the notes from the tone cluster in exercise #3 as the melodic source

C7-5 **Fmaj 11-9**



Exercise #3*

Exercise number two uses the same principal tones (C and F#) and adds notes1 ½ steps above each tone (Eb and A). *This pattern was not included in Slonimsky's original work; I include it as it creates a diminished arpeggio which is used frequently and to good advantage by the jazz player. All chords following will be a suitable



I should note at this point, the diminished chord I reference is properly called a diminished 7th. A diminished chord is a triad made up of root, flat 3rd, and flat 5th.The diminished chord in this example is 1,b3,b5,andbb7 (6). For a jazz study the diminished chord will be more frequently used.

The diminished arpeggio presents a unique situation. Each note of the pattern can be considered the root so playing any diminished implies four diminished chords. This is due to the fact that all notes are equally spaced from one another. Also when considering roots outside of the roots suggested by the cluster tones (see chart below) two other chord types are generated; the 7th flatted 9th (7-9), and the maj.7 flatted 13th (maj7-13). In other words, playing one diminished chord can imply 12 different chords when your bass player is playing the alternate bass note. This characteristic makes for easy playing as well.

Analysis

Cluster Tones-->	C	Eb	F#/Gb	A	chord implied	Character

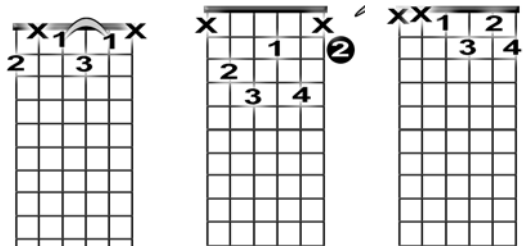
The chromatic scale as possible roots

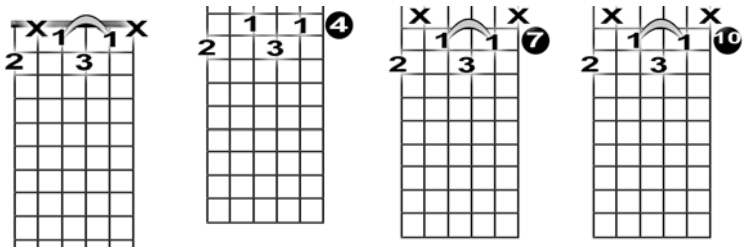
Cluster tones create these intervals when a root is chosen from chromatic scale

I use only 3 diminished chord forms:



Each chord shown has the same roots; **C, Eb, Gb, or A**

Each form repeats in a linear fashion along the neck every 4th fret (add 3 to fret you are on)



These are all the same root chord C, Eb, Gb, or A

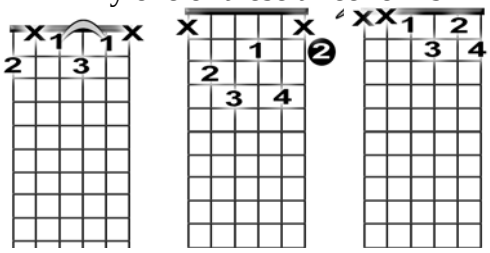
In summary:

Chords generated by this pattern tend to be dissonant, dominant qualities despite the analysis that would reveal a tonic quality (maj9-13). When viewing this chord as triads super imposed upon one another, they contain the one chord as well as the five chord as well. This leads to a non-committed quality so I don't try to qualify it as a one chord…it just doesn't work for my ear except in very *out* harmonic situations. So we are left with the diminished chord and the dominant 7th with a flatted fifth and the one chord that sounds more like a five chord.

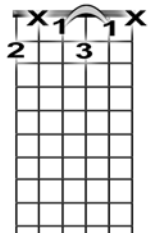
Any one of these three forms

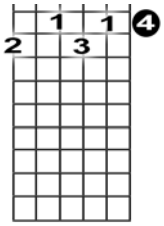


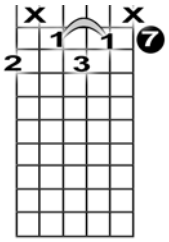
will satisfy the names in the graph below

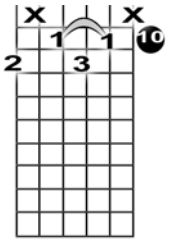
C dim 7	**B7-9**
Eb dim 7th	**D7-9**
Gb dim 7th	**F7-9**
A dim 7th	**Ab7-9**

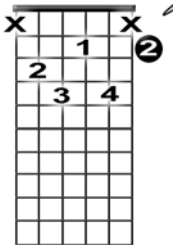
Each one of these chords will repeat by moving up the neck 3 frets (minor third movement)

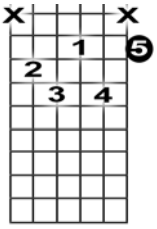
A dim 7	**C dim 7**	**D#/Eb dim 7**	**F#/Gb dim 7**
									


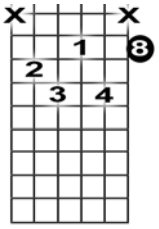


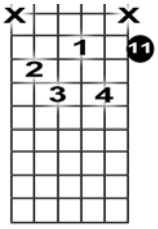


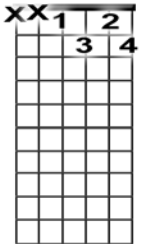


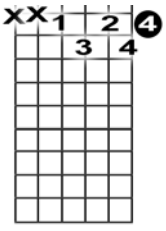


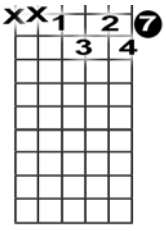


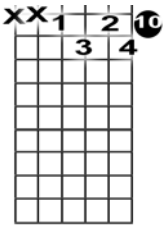








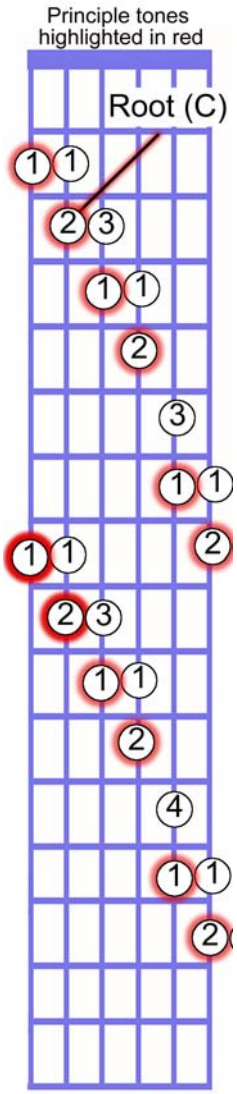




Exercise #4

Exercise number two uses the same principal tones (C and F#) and adds notes2 steps above each tone (F and B)

Fingering is strictly personal and dependant upon direction and range of line.
Experiment.
IF IT SOUNDS RIGHT IT IS RIGHT



Analysis

The chromatic scale as possible roots

Cluster tones create these intervals when a root is chosen from chromatic scale

* **Character;** this is a rough determination as to how the chord might be used.

- Release= I chord
- Build= II chord
- Tension = V chord

This determination has been made by the structure, the sound and connotation will help you make the decision as to how the chord is used.

Cluster tones as the Major 3rd and Dominant 7th are perhaps the most useful forms, and the most clearly stated sounds. IF IT SOUNDS RIGHT, IT IS RIGHT!

In summary:

This relationship, i.e., cluster tones C, E, Gb, Bb brings out much of what was generated in previous patterns. Your ear and discretion will have much influence on what you choose to play. Essentially you must look for a predominant sound that the pattern creates, i.e., major or minor; dominant or major 7th, etc.

Summary

Because of an increasing redundancy of tonal quality I will attempt to condense the remaining exercises by presenting the exercises (the tonal clusters) and encourage experimentation.
